

INAUGURAL · AGENTTAPE

TAPE-100

The first published edition of the AgentTape inaugural index. Every constituent on these pages was admitted by software, without a curated seed list, in the days leading up to this report.

How AgentTape works.

We do not curate. The discovery service watches GitHub, Hugging Face, MCP registries, npm and PyPI, arXiv, and Hacker News on its own schedule and admits agents to the index without human intervention. This report is the first formal snapshot of what that system has surfaced.

Once admitted, signals refresh on three independent tiers — fast (≈ 5 min for stars and HN mentions), medium (≈ 1 hour for forks, downloads, and package counts), and slow (daily for benchmark scores and citations). Scores recompute on a 60-second debounce per agent so the headline cannot be moved more than once a minute by any single signal.

The AgentScore is a 0–100 headline backed by four pillars: Adoption (35%), Quality (30%, “Unrated” when no benchmark data is yet available), Momentum (20%), and Community (15%). Quality’s weight is redistributed pro-rata when an agent is unrated so a young project is not penalized for the absence of benchmark coverage. Three manipulation rules — star spike without contributor diversity, HF download surge without GitHub activity, coordinated HN posting — exclude implicated signals from that day’s score and shrink the agent’s manipulation_resistance.

All inputs are reproducible. Every agent page exposes its raw signals as a CSV; every index publishes its rebalance log with diffs; the source of every methodology decision is in the public repository.

What the index is telling us.

Finding 1 · A new entrant in the top quartile

AutoGPT ranked #1 this week with an AgentScore of 63.4, despite being admitted only in the last day. It surfaced via *github search*. The autonomous discovery design exists for exactly this case — a project that is already attracting real signal but had not yet been written up.

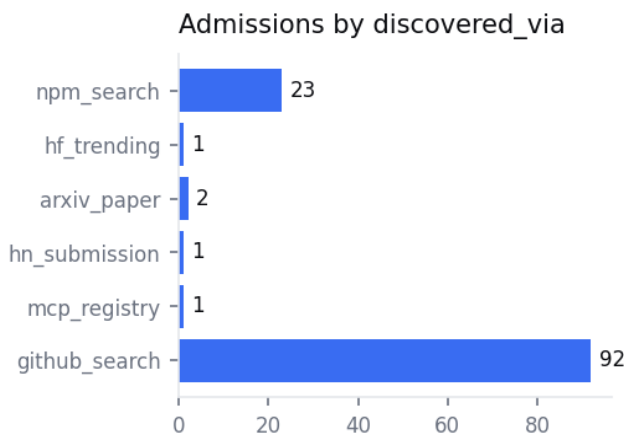

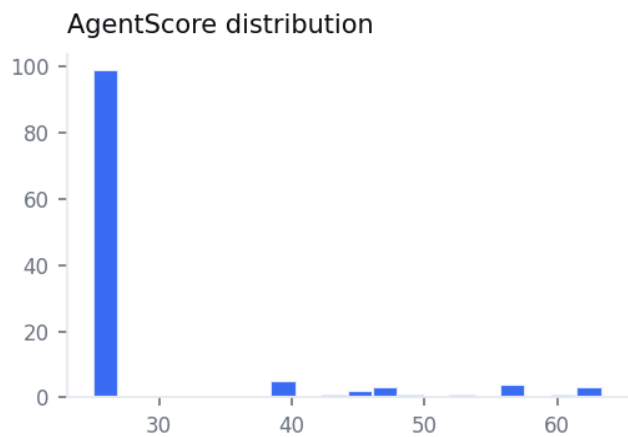

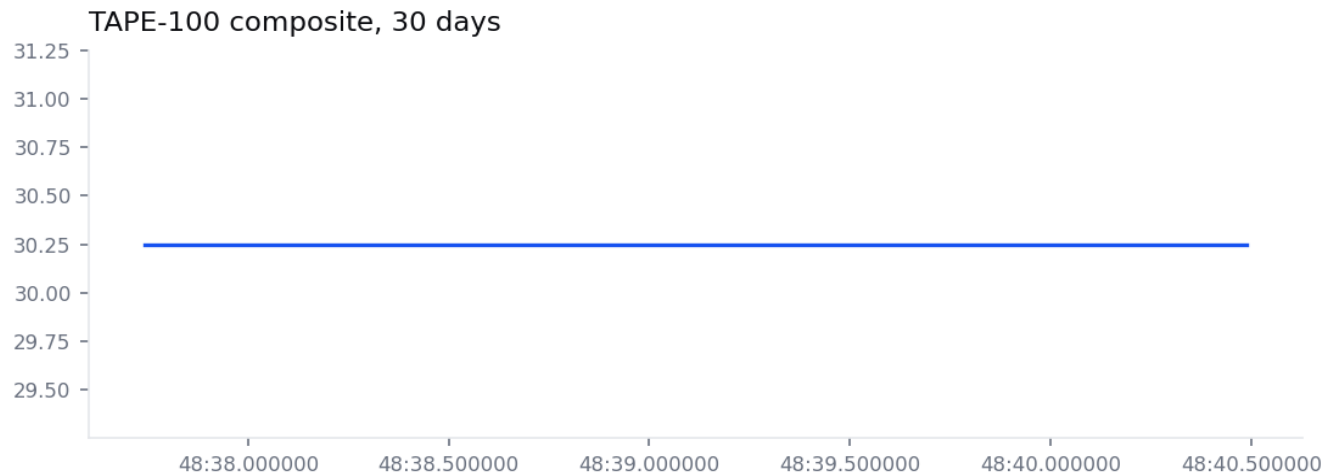

Finding 2 · Drawdowns were small this week

No agent in the index lost more than a single AgentScore point over the past seven days. This is what a slow, broad market looks like — no benchmark releases have shifted the quality pillar; the adoption tier is dominated by mid-week star and download accumulation.

Finding 3 · Concentration in the top 10

The top 10 constituents account for **19.1%** of total AgentScore in TAPE-100 (577.9 of 3025.0). Quality coverage is uneven: 0 agents have at least one benchmark result; the remaining 100 are Unrated. The Quality pillar will become the dominant separator as benchmark coverage broadens — the index is currently rewarding Adoption and Momentum more than the methodology weighting suggests.

How the index is shaped.
